

- The error is that the function does not properly differentiate values into the individual specified groups. When dividing by 10, the function can place 10 inside slot 1 instead of 0, 20 in slot 2 instead of 1, and so on, as well as go out of bounds if the inputArray has a value of 50 or greater.
- There was no request to initiate InputArray, to return the new array, or to print the new array values.
- Although I remember reading about the advanced for loop, I forgot how it was used, so it was interesting to relearn its syntax. If I was given this prompt, I would likely take the same approach ChatGPT used.
